

ABSTRACT

[Abstract of the Disclosure]

5 Provided is a slim optical disc drive. The slim optical disc drive includes a deck having a protrusion on which a spindle motor for rotating an optical disc and an optical pickup sliding along a radial direction of the optical disc drive are mounted, a lower case installed so that the deck slides into or out of the lower case and having a penetration corresponding to the protrusion, and a cover that covers the penetration.

10 According to the such structure, when a CD-RW recording/reproducing function or a DVD reproducing function is added, a rear surface of an optical disk drive and a FPC can be prevented from being exposed to the outside, and quality of the appearance of a product can be improved.
